This action is responsive to the amendment and remarks filed on June 11, 2007. Claims 1-2, 4, 7-17, 20-77, 79-80, 82-108, and 110-124 remain pending.

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 16, 29, 75, 107 and 108 are rejected under 35 U.S.C. 103(a) as being unpatentable over US 6,125,385 Wies et. al. (referred to as Wies hereafter) in view of Lindhorst et. al. US 6,337,696 (referred to as Lindhorst hereafter).

As per claim 1, Wies teaches substantially features of the invention, including system/method of adding interactive functionality to a web-page (Wies: col. 24/lines 25-62, col. 2/lines 6-27, 56-65), further including a system shown on Fig. 16 comprising: receiving at proxy server (400) a request (408) for a web page at on server (406) from a first user of computer (404); retrieving (410) by proxy server said requested web-page (412) on said server (Wies: col. 27/lines 37-46);

embedding or adding code by the proxy server to said requested web page to add said interactive functionality to the web-page (Wies: col. 12/lines 12-14, 23-41), where added code is performed by the proxy server wherein said adding or embedding step is

performed prior to providing the web-page in response to the web-page request (408) (Weis: column 27, lines 39-56); and providing the requested web page (414) having the embedded script code to said first user (Wies: col. 27/lines 37-46, col. 1 I/lines 32-41); however, Wies does not explicitly disclose determining within the page (i.e. parsing, scanning, searching or examining through) a location (called "appropriate: to embed a new script code.

Lindhorst in the same field of endeavor of applicant's invention, teaches parsing a document and determining a location to embed a new script code (original location col. 15/lines 8-58, Fig. 8, col. 21/lines 13-20, and insertion point col. 21/line 66-col. 23/line 34), further teaching embedding/adding objects within a document (col. 2/lines 21-31, i.e. a web page) to add functionalities to the page (col. 1/lines 36-46), objects comprising object including embedded script code such as AetiveX objects, scriptable HTML tags (col. 2/lines 47-50), the object provide interactive functionalities to the web page (col. 2/lines 51-58, including code implementing hyperlinks that add interactive functionalities to the web page col. 4/lines 64-col. 5/line 9); wherein the embedding script code to the web page comprises: parsing the page (step 110, 211, Fig. 3-4), identifying any existing objects, and scripts (step 120) and their location (col. 1 l/lines 30-65, Fig. 5), generating scripts that implement event/actions, i.e. interactive functionalities (col. 12/lines 7-32, col. 14/lines 47-55); embedding scripts in the page (col. 12/lines 24-32, 33-44), embedding comprising inserting the scripts in page in the same location where they were found (col. 15/lines 8-58, Fig. 8, col. 21/lines 13-20), and inserting (new) script codes in a determined insertion point location within the page

(col. 21/line 66-col. 23/line 34); embedding is preformed by software where embedding is performed by software, wherein said adding or embedding step is performed prior to providing the web-page in response to the web-page request (408) (column 2, lines 34-39 and 58-61).

It would have been obvious to one ordinary skilled in the art at the time the invention was made given the suggestions Wies for enhancing interactive functionalities on web pages the teachings of Lindhorst implementing a user interface for creating/editing these interactive functionalities on a web pages. One would be motivate to incorporate Lindhorst teachings into enable one without extreme complexity, writing a single line of code or extensive programming knowledge or the syntax thereof implement the enhancement, taught by Wies.

As per claim 16, Wies-Lindhorst teaches in addition to the features of claim 1, the "first" user has a "computing" device (14) connectable to the Internet (12) (Wies: col. 5/lines 60-col. 6/line 13) using an "Internet" browser (200) stored on the first user's computing device (Wies: col. 9/lines 43-58, col. 14/lines 54-55, col. I/lines 39-col. 2/line 5), the Interact browser enabling the first user to cause the computing device to establish a connection to the Interact via predetermined transmission protocol, and to request and receive web-pages (Wies: col. I/lines 39-col. 2/line 5), said system comprising: the first user computing device being connectable to a server using the Internet browser (Wies: col. 1/lines 39-65, proxy server col. 4/lines 12-14, col. 12/lines 12-14, 23-41 and col. 27/lines 24-56), said proxy server being operable in connection with software loaded on the server for receiving a request from the first user for the web-page (Wies: col. I/lines

35-58), said server configurable for performing the retrieving and adding "embedding" and transmitting functions discussed on claim 1, wherein said adding or embedding step is performed prior to providing the web-page in response to the web-page request (408).

As per claim 29, this is the computer readable medium comprising computer code for instructing one or more processors to perform the functions of claim 1, same rationale of rejection is applicable. As per claim 75, this claim comprises limitation substantially the same as claim 1, same rationale of rejection is applicable, however in the claim inserting, adding or embedding of code is performed by inserting, adding or embedding a "reference" to the code wherein said adding or embedding step is performed prior to providing the web-page in response to the web-page request (408), this functionality is taught by Wies (col. 27/lines 25-50, reference to code to add functionalities see col. 25/lines 24-38).

As per claim 107, this claim is substantially the same as combined limitations of claims 16 and 75, same rationale of rejection is applicable.

As per claim 108, this claim comprises the computer readable medium comprising computer code for instructing one or more processors to perform the functions of claim 75, same rationale of rejection is applicable.

Art Unit: 2151

Claims 2, 4, 9-13, 17, 22-26, 30-74, 76-77, 79-80, 82, 85-106, 110-124 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wies in view Lindhorst in further view of U.S. 5,996,003 NAMIKATA et. al. (Namikata hereafter).

As per claim 2, receiving a request for a web-page from a "second" user of a "second" computer (Wies: col. 1 I/lines 45-52); and transmitting a requested web-page and having "embedded script code to the second user (Wies: col. 1 I/lines 56-58); the script code enabling the first user and the second user to interact with each other while viewing the requested web page (Wies: col. 6/lines 47-60, col. 12/lines 3-21); although Wies teaches where the first and the second user/computer can request/receive web pages having "embedded script" code, it does not teach where said user request the page.

Namikata teaches a system/method wherein a second user is configured to select any one of the pages selected by .a first user (col. 5/lines 26-35), thereby, providing through a network (20) the web page to each first and second user (col. 5/lines 4-25, col. 4/lines 58-60, for displaying the page by all users, col. 5/lines 39-45, 60-63).

It would have been obvious to one ordinary skilled in the art at the time the invention was made given the suggestions of Namikata with respect to the method for implementing document selection, distribution and its format. One ordinary skilled in the art would be motivated to combine the teachings of Namikata and Wies for including a web page as defined by Wies, having embedded script code at different locations thereof, according to the various method of embedding therein taught by Wies, to add

Art Unit: 2151

Java or ActiveX code in web pages or by reference therein, either added by a server, proxy server, upon authoring of the web page or at the client, as taught by Wies, enabling clients and servers to interact with one another.

As per claim 4, parsing the web page to determine an appropriate location to embed the script code, wherein the location is in the "header" top or beginning included in the web page (Wies: col. 15 - lines 64-col. 16/line 3 and Lindhorst: col. 15/lines 52-54).

Claims 7-8, 20-21 and 83-84 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wies-Lindhorst in view of Namikata in further view of U.S. 5,708,780 LEVERGOOD et. al. (Levergood hereafter).

As per claims 7-8, neither Wies nor Namikata teach any user authentication methodology. Levergood teaches receiving user account data from a user and determining based on the user account data whether the user is authorized to access a requested page (col. 6/lines 58-eol 7/lines 13). It would have been obvious to one ordinary skilled in the art at the time the invention was made given the suggestion of Wies of the use of a proxy server for controlling internet access beyond the firewall and the user of a gateway typically Internet service provider (ISP). One ordinary skilled would be motivated to utilize common authentication schemes for the first and second user accessing the Internet including the teachings of Levergood on a gateway, proxy

server or ISP to control the access to users how have paid for the access to said web pages.

As per claims 20-21, these system claim comprise the server operable in connection with the software for performing the functions discussed on claims 7-8, same rationale of rejection is applicable.

As per claims-83-84, these claims are substantially the same as claims 7-8, same rationale of rejection is applicable.

As per claim 9, wherein each of the first user (14) and the second user (16) have a computing device (Wies: col. 5/lines 60-67) having a display on which the web-page is displayed (Wies: 28 and 30 of Fig. 1), (col. 3/lines 43-46, col. 6/lines 20-23, 27-46), the first user's computing device having a cursor control device (Wies: mouse 36, col.

9/lines 9-15) to control movement of a cursor on the first user's display (Wies: col. 3/lines 46-48, col. 8/lines 8- 26, 60-col. 9/line 4), and wherein the script code embedded within each user's web page adds interactive functionalities to the web page by enabling the transmission of cursor (force feedback) commands to the second user (Wies; col. 6/lines 47-60), force feedback commands displaying one movement of the first user's cursor on the web page (Wies; col. 7/lines 36-44).

As per claim 10, including limitations discussed on claim 9, same rationale of rejection is applicable, claim 10, further including: the graphical objects "elements" of the same web-page viewed by the first user and the second user are assigned the attributes

Art Unit: 2151

including position, tag and type ("identifiers), used for identifying the occurrence of an event or mouse movement, e.g. the particular relevant element that is the subject of actions e.g. "touched" by the first user (Wies: col. 19/lines 48-col. 21/line 19, identify touching relevant object pseudo-code including "elem.tagName" see col. 20/line 6-col. 21/line 19, or name of the object see col. 23/lines 36-45);

transmitting the identifier to the second user's computing device (Wies: col. 4/lines 47-60, col. 14/lines 63-65, Namikata: Fig. 6a-e and step \$6 on Fig. 8); the actions of the first-user with respect to the identified elements coordinates of the web page can be communicated to the second user and displayed (Namikata: step S30 of Fig. 12, 18, col. 9/lines 50-59).

As per claim 11, Namikata teaches a system as shown on Fig. 3, including a first user (32) viewing a "web" page and a second user (33 or 34) (Fig. 3), in displaying for viewing a common "web" page (col. 2/lines 1-15, col. 6/lines 16-18), said method comprising: providing through a network (20) the web page to each of the first and second user (col. 5/lines 4-25, col. 4/lines 58-60, for displaying the page by all users, col. 5/lines 39-45, 60-63),

exchanging (transmitting/receiving) shared information among participants including "cursor coordinate" information from the first user (col. 6/lines 62-col. 7/line 12, 27-29, pointer position exchanged col. 9/lines 4-29), for displaying cursor position on the second user (col. 6/lines 3-8, 18-28, col. 8/lines 44-67), including transmitting cursor coordinate data (col. 9/lines 41-67); however Namikata does not teach the use of a page having added code to provide "interactive" functions therein;

Wies teaches adding code by the proxy server to said requested web page to add said interactive functionality to the web-page, wherein said adding or embedding step is performed prior to providing the web-page in response to the web-page request (col. 12/lines 12-14, 23-41).

It would have been obvious to one ordinary skilled in the art at the time the invention was made given the suggestions of Namikata with respect to the implemented document selection/distribution and format. One ordinary skilled in the art would be motivated to combine the teachings of Namikata and Wies for including document created by a content provider having a domain name associated with the Web, wherein this document inherent already include interactive functionalities, can be enhanced by inserting Java or ActiveX Code in web pages, either added by a server, proxy server, upon authoring' or at the client, as taught by Wies, enabling clients and servers to interact with one another.

As per claim 12, the cursor coordinate data is one point data (Namikata: coordinates of a pointer position see col. 9/lines 4-11, 50-59).

As per claim 13, transmitting to one of the first or the second user, an identity for the other one of the first or the second user (Namikata: user/computer name transmitted see col. 9/lines 41-49).

7. Claims 14-15 and 27-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wies- Lindhorst in view of Namikata further view of U.S. 6,128,649 SMITH et. al. (Smith hereafter)

Art Unit: 2151

As per claims 14-15, however the above-mentioned prior art does not teach determining the session status (join or leaving) of participant and informing to other said determined status Smith teaches deter mining as user (identity) join and leave a session and transmitting to each of the participants said determined status (col. 18/lines 17-25). It would have been obvious to one ordinary skilled in the art at the time the invention was made given the suggestions of Wies for having users participate in a communication session where data is exchange there, to include Smith's teachings. Motivation would be to offer an accurate view of the participants at all times.

As per claim 17, this claim is substantially the same as combined Claims 16 and 2, same rationale of rejection is applicable.

As per claims 18-19, these claims are substantially the same as claims 3 and 5, respectively, same rationale of rejection is applicable.

As per claim 22, this system claim is substantially the same as claim 9, discussed above, same rationale of rejection is applicable.

As per claim 23, this claim comprises the server and the script code further operable in connection with the software for performing the functions discussed on claim 10, same rationale of rejection is applicable.

As per claim 24, this claim comprises limitations similar to those discussed on claim 11, same rationale of rejection is applicable. Further limitations include computer "server" (100 of Fig. 1 and/or 41 of Fig. 4) configured ("software loaded") for "operable in connection with the software" performing, the providing, receiving and transmitting

functions discussed on claim 11, wherein said adding or embedding step is performed prior to providing the web-page in response to the web-page request (408), same rationale of rejection is applicable.

As per claims 25-26, this claim is substantially the same as claims 12-13, discussed above same rationale of rejection is applicable.

As per claims 27-28, these comprise the server being further operable in connection with software for performing the functions discussed on claims 14-15, same rationale of rejection is applicable.

As per claim 30, this computer readable medium comprising computer code for instructing one or more processors for performing the functions discussed on claim 2, same rationale of rejection is applicable.

As per claim 31, this claim is the computer readable medium comprising computer code for instructing one or more processors for performing the functions of the method claim 11, same rationale of rejection is applicable.

As per claims 32-35, wherein the embedding comprises storing the script code on a computing device of the first user (Wies: col. 2/lines 27-31), and downloading the script code for storage on the computing device (Wies: col. 2/lines 6-25), storing the script code on a computing device of a first user prior to embedding the script code within the requested web-page (Wies: col. 25/lines 24-42),

downloading the script code for storage for execution on the computing device col. 2/lines 6- 31).

As per claim 36, determining the first user's cursor position by obtaining cursor coordinate data as the first user causes the cursor to move over the displayed webpage (Wies: determine object that the mouse pointer is positioned over, e.g. position coordinates, object name, col. 23/lines 30-47); and transmitting the cursor coordinate data over which the first user's cursor is positioned to the second user so that the second user can perceive the first user's cursor position on the displayed web page (Namikata: transmitting/receiving shared information among participants including cursor coordinate" information from the first user, see col. 6/lines 62-col. 7/line 12, 27-29, pointer position exchanged col. 9/lines 4-29), for displaying cursor position on the second user (Namikata: col. 6/lines 3-8, 18-28, col. 8/lines 44-67), including transmitting cursor coordinate data (Namikata: col. 9/lines 41-67).

As per claim 37, this claim is substantially the same as claim 12, discussed above same rationale of rejection is applicable.

As per claim 38, wherein said draw data permits the second user to perceive drawing on the web-page performed by the first user (Namikata: col. 8/line 8-10 and col. 9/line 1-3).

As per claim 39, wherein the script code further enables the first user to switch between point modes and draw mode (Namikata: col. 8/lines 8-10, col. 9/lines 1-3).

Art Unit: 2151

As per claim 4, this claim is substantially the same as claim 9 (or 22) discussed above; same rationale of rejection is applicable.

As per claim 41, this claim is substantially the same as claim 36, "first" and "second" users are here described "the user" and the "other user", same rationale of rejection is applicable.

As per claims 42-44, these claims are substantially the same as claim 12 (or 37), 38 and 39, discussed above same rationale of rejection is applicable.

As per claim 45, storing information As per the relationship 'between the elements and the identifiers on the computing device of the first user and the second user (Wies:. col. 20/line 6-col. 21/line 19, name of the object see col. 23/lines 36-45, col. 18/lines 25-45).

As per claim 46, graphical objects "elements" identifiable by "HTML" tags provided in the HTML code web page file that defines the web-page and ther6 respective name (Wies: "elem.tagName" see col. 20/line 6-col. 21/line 19, name of the object see col. 23/lines 36-45, col. 18/lines 25-45).

As per claim 47, graphical object "element" on the web-page is characterized by a frame "bounding shape" defined by the script code, and provides a reference point position, coordinate or location from which various parts of the element may be located with on the web-page (Wies: col. 20/line 6-50, and col. 21/line 51-col. 22/lines 8).

As per claim 48, the graphical objects "element" of the web page for a hierarchical structure (i.e. a tree where the nodes correspond to the elements of the web page)

Art Unit: 2151

(Wies: col. 20/lines 19-50), each graphical object "node" has an unique identifier (Wies; col. 20/line 6-col. 21/line 19, or name of the object see col. 23/lines 36-45); and storing the graphical object nodes having a hierarchical structure 'tree" in a web page data file on the computing device of the first user and the second user invoked by the code for determining the particular element that is subject of actions by the user (Wies: col. 19/lines 48-col. 21/line 19, and col. 20/line 6-col. 21/line 19), and comparing the cursor coordinate data with the stored structured HTML file "tree", and parsing the tree to locate the graphical object dement corresponding to the identifier (Wies: col. 22/lines 9-50).

As per claim 49, this claim is substantially the same as claim 10, same rationale of rejection is applicable.

As per claim 50, this claim includes limitation discussed on claim 10, same rationale of rejection is applicable, further limitations, include, storing each identifier to be accessible by code for identifying a particular element subject to a user's action (Wies: identify touching relevant object pseudo-code including "elem.tagName" see col. 20/line 6-col. 21/line 19, name of the object see col. 23/lines 36-45); determining the first user's cursor position by obtaining cursor coordinate data as the first user causes the cursor to move over the displayed web-page (Wies: coordinates determination see col. 21/line 51-col. 22/lines 8) comparing the cursor coordinate data with the stored one or more identifiers to determine the element over which the first user's cursor is positioned (Wies: identify "touch object" see col. 20/lines 6-50); transmitting the cursor coordinate

Art Unit: 2151

data and identifier for the element over which the first user's cursor is positioned to the second user's computing device (Wies: determining coordinate col. 22/lines 19-33 and transmitting col. 6/lines 27-51); and locating the corresponding element on the second user's web page by using the identifier and respective object coordinates, so that the second user can perceive the first user's cursor position on the displayed web-page (Namikata: step \$30 of Fig. 12, 18, col. 9/lines 50-59).

As per claim 51, this claim is substantially the same as claim 48, same rationale of rejection is applicable.

As per claim 52, this claim is substantially the same as claim 46, same rationale of rejection is applicable.

As per claim 53, this claim is substantially the same as claim 50, same rationale of rejection is applicable.

As per claims 54-55, displaying one or more movements of one user's cursor on the web-page of the other user (Namikata: col. 8/lines 44-67, Wies: col. 3/lines 46-48, col. 7/lines 36-44) by transmitting cursor coordinates to the other user, wherein the received cursor coordinate data is one of the first user's cursor position or the second user's cursor position as the one of the first user or the second user causes the cursor to move over the displayed Web-page (Namikata: Fig. 6a-e and step S6 on Fig. 8, where the actions of one user are displayed to the other user, step S30 of Fig. 12, 18, col. 9/lines 50-59).

As per claim 56, this claim is substantially the same as claim 38, same rationale of

rejection is applicable.

As per claim 57, this claim is substantially the same as claims 10, 23 or 50 same

rationale of rejection is applicable.

As per claim 58, this claim is substantially the same as claim 48, same rationale of

rejection is applicable.

As per claim 59, this claim is substantially the same as claim 46 (or 52), same rationale

of rejection is applicable.

As per claims 60-61, these claims are substantially the same as claims 33-32, same

rationale of rejection is applicable.

As per claim 62, this claim comprises the server and script code further operable in

connection with the software to perform the functions discussed on claims 10, 23, 50 or

57, same rationale of rejection is applicable.

As per claim 63, this claim comprises the server and the script code further operable in

connection with the software to perform the functions discusses on claim 48, same

rationale of rejection is applicable.

As per claim 64, this claim is substantially the same as claim 46 (or 52 or 64), same

rationale of rejection is applicable.

Art Unit: 2151

As per claim 65, this claim comprises limitations from-claims 10, 36 and 41, same rationale-of rejection is applicable.

As per claim 66, this claim comprises the server and the script code further operable in connection with the software to perform the functions discussed on claim 36, same rationale of rejection is applicable.

As per claim 67, this claim is substantially the same as claim 12, discussed above same rationale of rejection is applicable.

As per claim 68, this claim is substantially the same as claim 38 or 43, same rationale of rejection is applicable.

As per claim 69, this claim is substantially the same as claim 9, same rationale of rejection is applicable.

As per claim 70, this claim is substantially the same as claim 36, same rationale of rejection is applicable.

As per claim 71, this claim is substantially the same as claim 12, discussed above same rationale of rejection is applicable.

As per claim 72, this claim is substantially the same as claims 38 or 43, or 68, same rationale of rejection is applicable.

As per claims 73-74, these claims are substantially the same as claims 32-33, same rationale of rejection is applicable.

Art Unit: 2151

As per claims 76-77, these claim include limitation of claim 75 and claim 2, same

rationale of rejection is applicable.

As per claim 79, these claims area substantially the same as claim 7, same rationale of

rejection is applicable.

As per claim 80, this claim is substantially the same as claim 77, same rationale of

rejection is applicable.

As per claim 82 these claims are substantially the same as claim 4, same rationale of

rejection is applicable.

As per claims 85-86, these claims comprises substantially the same limitations as

claims 32-33 and 75, same rationale of rejection is applicable.

As per claim 87, this claim is substantially the same as claims 9 (or 22, 40), same

rationale of rejection is applicable.

As per claim 88, this claim is substantially the same as claim 36, same rationale of

rejection is applicable.

As per claim 89, this claim is substantially the same as claim 12, discussed above same

rationale of rejection is applicable.

As per claims 90-91, these claims comprises substantially the same limitations as

claims 43-44, same rationale of rejection is applicable.

Art Unit: 2151

As per claim 92, this claim is substantially the same as claim 9 (or 22, 40, 87), same rationale of rejection is applicable.

As per claim 93, this claim comprises substantially the same limitations as claim 36, same rationale of rejection is applicable.

As per claims 94-96, these claims are substantially the same as claims 37-39, discussed above same rationale of rejection is applicable.

As per claim 97, this claim comprises substantially the-same limitations-discussed on claims 10,23, 50, 57, or 62, same rationale of rejection is applicable.

As per claim 98, this claim comprises substantially the same limitations discussed on claim 48, same rationale of rejection is applicable.

As per claim 99, this claim is substantially the same as claim 46 (or 52 or 64), same rationale of rejection is applicable.

As per claim 100, this claim is substantially the same as claim 47, same rationale of rejection is applicable.

As per claim 101, this claim is substantially the same as claim 48 (or 58), same rationale of rejection is applicable.

As per claim 102, this claim is substantially the same as claim 10, same rationale of rejection is applicable.

Art Unit: 2151

As per claim 103, this claim comprises substantially the same limitations discussed on claims 10 and 50, same rationale of rejection is applicable.

As per claim 104, this claim is substantially the same as claim 48 (or 58 or 101), same rationale of rejection is applicable.

As per claim 105, this claim is substantially the same as claim 46 (or 52 or 64 or 99), same rationale of rejection is applicable.

As per claim 106, this claim comprises the same limitation discussed on claims 10, 23, 50, 57, 62,97, same rationale of rejection is applicable.

As per claim 110, this claim is substantially the same as claims 32 and 75, same rationale of rejection is applicable.

As per claim 111, this claim comprises the computer readable medium comprising computer code for instructing one or more processors to perform the functions of the method claims 11 and 75, same rationale of rejection is applicable.

As per Claim 112, this claim comprises the software being operable in connection with software loaded therein for performing the functions of the method claims 16 and 75, same rationale of rejection is applicable.

As per claims 113-114, this claim is substantially the same as the combination of claims 10 and 100, same rationale of rejection is applicable.

Art Unit: 2151

As per claims 115, 117, 119, 121 and 123 these claims comprise limitations of claims 1 and 2, same rationale of rejection is applicable.

As per claims 116, 118, 120, 122 and 124 wherein the script code embedded within the webpage requested by the first user differs from the script code embedded within the web-page requested by the "second user (Wies: col. 3/lines 40-48, col. 4/lines 49-59)."

Response to Arguments

2. Applicant's arguments filed on June 11, 2007 have been fully considered but they are not persuasive.

As per claims 1, 16, 29, 75, 107 and 108 rejected as being unpatentable over Wies in view of Lindhorst, it is argued that Lindhorst does not teach claim limitation as amended. Specifically, Wies fails to teach, suggest or disclose embedding script code into a requested web-page by parsing the requested web-page to determine an appropriate location to embed the script code. It follows then that Wies also cannot teach, suggest or disclose the claimed embedding being performed prior to providing the web-page to the user in response to a web-page request. Wies explicitly teaches the process of embedding being performed prior to providing the web-page in response to a web-page request. Wies discloses the process of receiving at proxy server (400) a request (408) for a web page at on server (406) from a first user of computer (404); retrieving (410) by proxy server said requested web-page (412) on said server (Wies:

col. 27/lines 37-46); embedding or adding code by the proxy server to said requested web page to add said interactive functionality to the web-page (Wies: col. 12/lines 12-14, 23-41), where added code is performed by the proxy server wherein said adding or embedding step is performed prior to providing the web-page in response to the web-page request (408) (Weis: column 27, lines 39-56); and providing the requested web page (414) having the embedded script code to said first user (Wies: col. 27/lines 37-46, col. 1 I/lines 32-41).

Page 23

Wies does not explicitly disclose determining within the page (i.e. parsing, scanning, searching or examining through) a location (called "appropriate: to embed a new script code.

Lindhorst in the same field of endeavor of applicant's invention, teaches parsing a document and determining a location to embed a new script code (original location col. 15/lines 8-58, Fig. 8, col. 21/lines 13-20, and insertion point col. 21/line 66-col. 23/line 34), further teaching embedding/adding objects within a document (col. 2/lines 21-31, i.e. a web page) to add functionalities to the page (col. 1/lines 36-46), objects comprising object including embedded script code such as AetiveX objects, scriptable HTML tags (col. 2/lines 47-50), the object provide interactive functionalities to the web page (col. 2/lines 51-58, including code implementing hyperlinks that add interactive functionalities to the web page col. 4/lines 64-col. 5/line 9); wherein the embedding script code to the web page comprises: parsing the page (step 110, 211, Fig. 3-4), identifying any existing objects, and scripts (step 120) and their location (col. 1 I/lines 30-65, Fig. 5), generating scripts that implement event/actions, i.e. interactive

Art Unit: 2151

functionalities (col. 12/lines 7-32, col. 14/lines 47-55); embedding scripts in the page (col. 12/lines 24-32, 33-44), embedding comprising inserting the scripts in page in the same location where they were found (col. 15/lines 8-58, Fig. 8, col. 21/lines 13-20), and inserting (new) script codes in a determined insertion point location within the page (col. 21/line 66-col. 23/line 34); embedding is preformed by software where embedding is performed by software, wherein said adding or embedding step is performed prior to providing the web-page in response to the web-page request (408) (column 2, lines 34-39 and 58-61).

It would have been obvious to one ordinary skilled in the art at the time the invention was made given the suggestions Wies for enhancing interactive functionalities on web pages the teachings of Lindhorst implementing a user interface for creating/editing these interactive functionalities on a web pages. One would be motivate to incorporate Lindhorst teachings into enable one without extreme complexity, writing a single line of code or extensive programming knowledge or the syntax thereof implement the enhancement, taught by Wies.

As per claims 1, 16, 29, 75, 107 and 108 rejected as being unpatentable over Wies in view of Lindhorst, it is argued that there is no suggestion for the proposed hypothetical combination. Because according to applicant, Weis focuses on an environment to provide sensory feedback to a user by transmitting a web page to the user's computer, the web page containing objects to control operation of force feedback devices to provide the sensory feedback to the user. In contrast, Lindhorst describes an editing/development environment in which a user can edit an HTML object/document.

The two environments are not at all compatible, and neither provides a suggestion, motivation or teaching to combine, let alone to make the hypothetical combination suggested in the Office Action. Applicant further states that the combination of Wies and Lindhorst would result in inoperable for their intended purpose. In response 'to applicant's argument that "environments are not compatible", the test for obviousness is not whether the features of a secondary reference may be bodily incorporated into the structure of the primary reference; nor is it that the claimed invention must be expressly suggested in any one or all of the references. Rather, the test is what the combined teachings of the references would have suggested to those of ordinary skill in the art. See In re Keller, 642 F.2d 413, 208 USPQ 871 (CCPA1981).

In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See In re Fine, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and In re Jones, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, the Weis reference explicitly teaches an web authoring application interface tool for authoring web pages for use with application programs for allows users inexperienced with HTML syntax and unfamiliar with force feedback to quickly create HTML pages with feel content, along with standard content such as graphics, text, and sound, where the application uses common user interface feature found in most web authoring

applications today. These features should allow the user to easily insert and place content and immediately feel, see, and hear the results. Once the web page is saved as a file by the authoring interface, the user can send the created web page to a web server to be accessible to end users over the Internet or other network; or, the saved web page might be already available over the Internet if it is resident on a machine (such as a client machine) having appropriate accessibility over the Internet (or other network) (column 30, lines 8-30). Weis suggest using scripts, e.g. ActiveX controls which are programmable acts that can be embedded into Web pages and may be written in any (platform-specific) language. Java and ActiveX controls can add functionality to a Web page that would normally be difficult, or even impossible, using HTML or scripting languages. ActiveX controls can also be controlled with a scripting language. Alternatively, functionality can be added to a web page through the use of "plug-ins", which are application programs running in conjunction with certain web browsers to parse plug-in-specific code in the web page which the browser cannot understand (column 2, lines 6-31).

Hence, according to Applicant's characterization of the Lindhorst reference which "describes an editing/development environment in which a user can edit an HTML object/document". Weis suggest various applications in Lindhorst's system.

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Zarni Maung whose telephone number is (571) 272-3939. The Examiner can normally be reached on Monday-Friday from 6:30 to 3:00 p.m. If attempts to reach the examiner by telephone are unsuccessful, the Examiner's Supervisor, Valencia Martin-Wallace can be reached at (571) 272-3440. Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-3800/4700. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system, status information for published application may be obtained from either Private or Public PAIR, for unpublished application Private PAIR only (see http://pair-direct.uspto.gov or the Electronic Business Center at 866-217-9197 (toll-free).
